

See the two tab delimited files attached:

products.tab = A list of product names tab delimited with categories

sales.tab = A list of product names tab delimited with sales amount

From this data we'd like you to answer two questions:

1. What are the top 5 categories by sales
2. What is the top product by sales in category 'Candy'

This comes from when I worked at a company that made back office software for restaurants. You can imagine the second file is a Point of Sale record for the day.

Conditions of Satisfaction:

- All code should be checked into your Github profile and publicly accessible, commit any/all iterations please.
- Use JS and/or Python (an extensible OO design is good!)
- Bonus Points for implementing a chart (use JS library of your choice, d3?) that answer the above questions.
